

FinHealthSnap: Windows Setup Guide

Follow these instructions to launch FinHealthSnap on your Windows PC.

Prerequisites

1. Download and install **Docker Desktop for Windows**: <https://www.docker.com/products/docker-desktop/>
2. During installation, make sure **WSL 2** (Windows Subsystem for Linux) is enabled if prompted.
3. Open Docker Desktop and ensure it is running (you should see the Docker icon in your system tray on the bottom right).

Step 1: Unzip the Application

1. Right-click the `FinHealthSnap_App.zip` file and select **Extract All...**
2. Move the extracted `FinHealthSnap_App` folder to your `Documents` or `Desktop` for easy access.

Step 2: Load the Application Image

1. Open **PowerShell** or **Command Prompt** (Press `Win`, type "PowerShell", and hit Enter).
2. Type `cd` (with a space at the end) and drag the `FinHealthSnap_App` folder from File Explorer into the PowerShell window, then press Enter.
3. Run the following command to load the application into Docker:

```
docker load -i finhealthsnap-release.tar
```

Wait for it to say "Loaded image: finhealthsnap-release:latest".

Step 3: Database Configuration

You have two options for your data:

Option A: Start Fresh (Recommended for new users)

You don't need to do anything. The default `docker-compose.yml` file is already set up to create a brand new, permanent database for you.

Option B: Use an Existing Database

If you received an existing `dev.db` file containing old data:

1. Create a folder named `prisma` inside the `FinHealthSnap_App` folder.
2. Place the `dev.db` file inside that `prisma` folder.
3. Open `docker-compose.yml` in Notepad.
4. Find the `volumes:` section and change it to look exactly like this:

```
volumes:
  - ./prisma:/app/prisma
```

5. Delete the bottom two lines (`volumes:` and `finhealth-db:`).
6. Save the file.

Step 4: Launch the Application

In your PowerShell window (still inside the `FinHealthSnap_App` folder), run:

```
docker compose up -d
```

Step 5: Access the App

1. Open your web browser (Chrome, Edge, Firefox) and go to: <http://localhost:3005>
2. If you chose Option A (Fresh Start), click "Register" or "Sign Up" to create your new account.
3. If you chose Option B, log in with your existing credentials.

To stop the app: Run `docker compose down` in your PowerShell window.

How to Restart the App Later

If you have stopped the app or restarted your computer, follow these steps to bring it back up:

1. Open **PowerShell** and ensure Docker Desktop is running.
2. Type `cd` (with a space at the end) and drag the `FinHealthSnap_App` folder into the PowerShell window, then press Enter.
3. Run the following command:

```
docker compose up -d
```

4. Access the app at <http://localhost:3005>
